

■ CHARACTER DEVELOPMENT BLUEPRINT: PHOTO-BASED RETRO PIPELINE

Target Aesthetic: 1980s Outrun, Synthwave Neon, & Gritty VHS Analog Horror (Kavinsky / Project Nightmare Style)

■ MANDATORY DIRECTIVE FOR ALL INCOMING AI ASSISTANTS

STRICTLY FORBIDDEN: Do not generate generic, clean, modern vector art, anime illustrations, or standard 3D asset models. Any character art or asset texture built from scratch without aligning with the photorealistic source materials breaks the creative intent.

APPROVED PIPELINE: All character development must use **real reference photographs** (using actual costumes, real actors, and physical props) as the primary base. The AI's job is exclusively to post-process, pixelate, texture-map, color-grade, and warp these source assets into the target aesthetic outlined below.

■ VISUAL TRANSLATION GOALS (REF: SUPPLIED CONCEPTS)

The provided real-world reference photos must undergo a digital transformation pipeline to mirror the target visual references:

- **High-Contrast Graphic Novel & Cel-Shaded Vibe (Kavinsky Style):** Convert clothing, faces, and folds into hard, graphic ink outlines. Maximize contrast by using a heavy black backdrop and flat, bold primary colors (like bright bomber jacket reds and neon blue hair highlights) against deeply saturated shadows.
- **Cyberpunk Industrial Realism (Project Nightmare Style):** Embed characters realistically into low-light, rain-slicked, and concrete environments. Dark uniforms or leather textures must capture complex magenta, cyan, and deep violet rim lighting cast from external electronic objects.
- **Analog VHS Corruption & Grain:** All finished imagery must be degraded. Introduce chromatic color separation (red/blue edge bleeding), structural horizontal scanlines, subtle tracking distortion lines, and organic analog film grain to mimic old tape recordings.

■■ WORKFLOW CHANNELS: HOW THE AI PROCESSES IMAGES

Pipeline Option	Input Action	AI Execution Steps
1. Digitized 2D Sprite (Classic Retro Doom / Mortal Kombat style)	Take real costume photos from multiple cardinal angles (Front, Back, Profiles).	1. Automatically cut out and remove the background canvas. 2. Downscale target resolutions directly to a crunchy, pixelated grid (e.g., 128x128 or 256x256). 3. Enforce an indexed, low-range color palette.
2. Photo-To-Texture Mesh (Gritty Chilla's Art style)	Take flat, neutral-lit textures of masks, faces, and costume fabrics.	1. Convert raw photographs into flat, optimized texture maps. 2. Map these custom textures onto simple, blocky, low-poly 3D character meshes. 3. Let the heavy screen-space VHS shader handle blending artifacts seamlessly.

■ ASSET INGESTION CONSTRAINTS FOR USER CODES

To ensure the processing scripts write code flawlessly, incoming source photos in the dropzone must follow these limits:

- 1. Chroma Isolation:** Source photographs should be captured against a solid, non-reflective backdrop (white/green) for easy alpha channel mask generation.
- 2. Neutral Diffuse Lighting:** Use balanced lighting conditions. Do not introduce heavy direction lights in raw photos; lighting should be calculated dynamically by shaders inside Godot.
- 3. Anisotropic Layout:** Keep filenames descriptive in snake_case (e.g., villain_stalker_walk_front.png) so automation code registers scripts instantly.
